Introducing Selective Solder Technology

Faster and Better. We've taken another big step forward.

At the beginning of this month, we introduced a new technology onto our Denver facility floor: The Ersa SMARTFLOW 2020 Selective Solder System. This piece of equipment has been on our wish list for quite some time, and we're excited to announce that it's finally in operation!

Investing in Better Tech

With the new selective solder system in place, our team can move jobs quicker through production, and complete manually challenging soldering steps with ease and precision. Our new machine features touch-screen technology and CAD-assist, making it easy to guide and operate. By decreasing the burden of manual soldering, our team can focus on maintaining and improving the processes that move jobs through the floor the quickest, while eliminating the need for rework. Our goal is to offer our customers the best PCB prototype experience

possible. The better our technology and the more efficient our workflows, the sooner we can deliver high-quality, high-complexity boards to customers who need them when they need them.

To learn more about how this increases productivity and decreases the need for rework, [read more on our blog](#).

Engineering and Design Tips & Tricks:

1. Including CAD data with your Gerber files increases DFA accuracy and speed
2. Call out wash sensitive parts on your assembly drawing or in the quote request
3. Include alternate engineering contacts if you will be unavailable during the assembly time.
